

How to Wash and Car Wax

To some, car wax is like putting on cologne or eye shadow. It helps you appear shinier and put together, but is not a requirement. Quite the contrary. Using car wax is more like using sun protection or eating a balanced diet. It provides protection for the painted surfaces of the car and prevents fading in those areas. Your car will perform better and last longer, if you have a routine of washing, waxing and keeping up with service and repairs. Most auto experts recommend washing your car at least once a month. The surface of your car bears the brunt of the daily things present in our environment. Tree sap, dirt, and bugs get stuck on there and can leave permanent spots. (If you already have some spots from years of non washing, take comfort in knowing car wax might help.) If you are washing your car at home, make sure you use non abrasive cleaning mitts and a car safe detergent. Regular old dish detergent is usually not recommended. Do not plunge your dirty wash mitt back into the soapy water. Dip your dirty wash mitt in a separate rinse container before you stick it back in the container with the sudsy water. Clean in places where grime and dirt might be hiding, like behind bumpers and around the license plate. Many experts say to use one of those power sprayers a couple times a year. Hold the nozzle at a safe distance, so you do not risk peeling off any loose paint. I, personally, prefer the at home method of car washing and avoid those power things. Use a microfiber cloth to wipe up any remaining water, when you are finished washing. Get the car wax ready, now that your car is dry. You can choose from a wide assortment of car wax. There are natural ones and synthetic ones. If you use quality car wax, you will likely only have to reapply every two or three months. You will need a soft sponge and a clean cloth. Working in sections, put the car wax on in a light layer. Buff the wax off with your clean rag after the waxed areas look hazy. Shake out the cloth a lot to avoid wax build up. While you are washing and applying car wax, pay attention to any new scratches, dents or rust. Things that start small can easily become corroded or damaged. Take your car to a body shop to have those small things repaired, or do it yourself. Be certain to get oil changes, maintenance check ups, and recommended service. Your car will perform well for you for many years, if you frequently give it a wash, a dose of car wax, and keep up with the maintenance and service.
